

What Are You Proving?

Proof Statement:

My portfolio proves that I can turn raw subscription billing and usage data into a weekly list of exactly which customers to contact before they cancel. It's built for a senior data analyst at a small subscription startup (10–50 people) who is overloaded with requests and needs someone who can turn a vague ask like 'who's at risk' into a ready-to-use list without follow-up questions. After reading it, that person should message me on LinkedIn to start the hiring conversation.

Why this need exists:

A CV or LinkedIn can *claim* I know SQL, Python, and "data-driven decision making." It cannot show a stranger what my actual output looks like under a real request. Owning a project fixes this because it replaces a claim with evidence: the analyst can see, before ever contacting, whether they'd hand a request and get back exactly what they needed.
